CI PHASE SHIFT FUNCION TEST

CONCEPT OF TEST : This test is to prove that data that locates in CI 1 will transfer to CI 2. In this test two(2) CDT, two(2) C/I and two(2) Communication System were used in order to prove that data can be transferred between two cars.

1. CAR CONFIGURATION

   To test that car configuration will transfer to C/I 1 and C/I 2 through CDT 1 and CDT 2 from Communication System.

No	Consist of	Pass/Fail	Sign			Remarks
			WOOJIN	MELCO	HR	
1	2 car	P		S.E		
2	4 car	P		S.E		
3	6 car	P		S.E		
4	8 car	P		S.E		

Yeonjun Song Shinj Euoto
JongHyun Lee

2. C/I POSITION

   To test that the Communication system send out correct C/I position information to correct C/I.

No	Car Number	Pass/Fail	Sign			Remarks
			WOOJIN	MELCO	HR	
1	1	P		S.E		
2	2	P		S.E		
3	3	P		S.E		
4	4	P		S.E		

5	5	P		S.E		
6	6	P		S.E		
7	7	P		S.E		
8	8	P		S.E		

3. OTHER C/I FAULT

Purpose of this test is to: when fault occurs on one of the C/I, the information transfers to the other C/I through CDT and the Communication System under various condition (different car number and different car quantity).

Also to test if C/I calculates proper phase shift degree.

No	Car Number	Consist of	Phase Shift Degree	Pass /Fail	Sign			Remarks
					WOOJIN	MELCO	HR	
1	#1 and #2	2 cars	90° → 0° 0° → 0°	P		S.E		
2	#7 and #8	8 cars	135° → 154.3° 157.5° → 154.3°	P		S.E		
3	#1 and #3	4 cars	0° → 0° 90° → 60°	P		S.E		
4	#5 and #6	6 cars	120° → 144° 150° → 144°	P		S.E		
5	#4 and #5	6 cars	90° → 108° 120° → 108°	P		S.E
